(57) **ABSTRACT**

Disclosed herein is a fusing device. The fusing device includes a first heating source including a first heater and a first conductor connected to the first heater, a second heating source including a second heater and a second conductor connected to the second heater, a fusing member heated by at least one of the first heating source and the second heating source. The fusing device includes a pressing member disposed to face the fusing member to press a printing medium toward the fusing member, where the first heating source includes a first non-heater portion in which the first heater or the first conductor is sealed so that a part of the first heating source does not generate heat.
